1. The Problem

In most restaurants, ordering still depends on a single point of contact: a cashier or a waiter. When the place gets busy, customers are forced to wait just to **place** an order, long before any food is prepared.

- **Long queues** - customers stand in line at the counter only to place an order.
- **Waiting for a waiter** - seated guests have to catch someone's attention, then wait again for the order to be taken.
- **Staff overload** - waiters and cashiers spend their time taking orders instead of serving guests.
- **Order mistakes** - verbal orders and handwritten notes are easy to mishear, lose or write incorrectly.
- **Poor customer experience** - slower service, frustrated customers and lower table turnover.

2. What We Are Solving

RMS removes the queue completely. Every table has its own **QR code**. The customer scans it with their phone, browses the menu and places the order **by themselves** - no waiting in line, no waiting for a waiter. The order reaches the staff instantly.

1. Scan	2. Order	3. Submit	4. Confirm	5. Track
Customer scans the QR code on the table	Browses the menu, adds items and enters their name	Order is sent live to the staff dashboard	Staff confirms it and the kitchen receipt prints	Customer sees the order status on their phone

- **No more queues** - customers order directly from their own seat.
- **Faster service** - orders arrive instantly and staff focus on serving food.
- **Fewer errors** - the customer enters the order themselves, so nothing is misheard.
- **Real-time tracking** - customers see their order move from Pending to Confirmed.
- **Secure and reliable** - every table has a unique, unguessable QR token, and order prices are verified on the server.
